

Project 1 reviews are up — and the remaining discussion sessions have changed

01-ml-project — Customer Segmentation · 4 September 2026

Everyone's final review for 01-ml-project is now in the repo. I read every notebook myself, so these are my notes, not your mentor's.

Find yours

```
git pull origin main
```

Then open `submissions/a1-mon-thu/<your-group-id>/01-ml-project/<your-group-id>_final-review.md`

Each one has an outcome at the top:

- **Accepted** — you're done. Nothing further.
- **Revise by Mon 07/09** — a numbered list of what to fix. Each item says which rule in `SUBMISSION_CRITERIA.md` it comes from, so you can check it yourself.
- **Not submitted** — nothing reached the repo.

Across the cohort: **8 accepted, 6 to revise, 1 with nothing submitted**. Most of the revisions are small — two groups only need to re-run their notebook and commit it with the outputs saved. The work underneath was already correct; it just isn't visible in what you pushed.

There is also a personal note to your team at the end of every review. Please read it.

Catch-up deadline — Monday 07/09, end of day. If your review says Revise or Not submitted, push before then.

Remaining sessions

I've compressed the last two sessions rather than running the old three-to-four-groups-per-session rotation. It was stretching Project 1 across two weeks, which meant the last groups presented work they'd finished ten days earlier.

SESSION	DATE	PRESENTING
S12	Mon 07/09	a1-g09, a1-g11, a1-g12, a1-g14, a1-g15
S13	Thu 10/09	a1-g02, a1-g03, a1-g04, a1-g06, a1-g08, a1-g10

S13 is a “**what we changed and why**” session — five minutes on what your review asked for and how you fixed it. That's more useful to the room than another walkthrough, so come ready to talk about the

change, not the whole project.

a1-g01, a1-g05 and a1-g07 presented already and are accepted — you're closed out.

a1-g13 — I have nothing from you at all. Message me today.

Two things worth everyone reading

Your notebook is the deliverable, not your code. Three groups did correct work that I couldn't see: two committed with all outputs stripped, one saved its best tables as `.style` objects, which don't survive the save. Always Restart & Run All, then commit *with* outputs, then open the file on GitHub and look at what's actually there.

Don't hardcode `{0: "VIP", 1: "Regular"}`. K-Means numbers its clusters arbitrarily — change the seed or the sklearn version and every name silently lands on the wrong group. Derive the names from the table instead: `cluster_means["Monetary"].idxmax()` gives you the VIP cluster in one line and can never drift. a1-g03, a1-g06 and a1-g09 all did this; it's two lines and it removes a whole class of error.

One more: the written recap rule is **gone**. It asked for a recap only from groups not in the spotlight, but the rotation spotlighted everyone, so it never actually applied. `SUBMISSION_GUIDE.md` and the criteria are updated.

Questions on your own review come to me directly — your mentor's stage is finished. Anything about this announcement goes in the comments so the whole cohort sees the answer once.

— Hozaiifa Moustafa
